About

Full Stack developer with over 3 years of experience in developing and designing web applications. Specialized in creating dynamic and fast web applications using Laravel, Vue.js, and Tailwind CSS. I have a great passion for writing clean and maintainable code and solving complex problems.

Practical Experiences

Applying what I learned from Laravel courses

2022 - Present

Development and management of integrated web platforms

Developing an integrated content management system using Laravel, Livewire, (PHP OOP), (LocalStorage JS) Building application programming interfaces (APIs) Designing interactive user interfaces using tailwindCSS Improving MySQL database performance and writing complex queries

Joint project with the front-end team

2022 - Present

Development of web applications and e-commerce

Developing e-commerce platforms using Laravel and Vue.js
 Integrating payment systems and electronic gateways,
 Improving application performance and enhancing

user experience.

Notable projects

Library Management System

An integrated system for managing books, inventory, and users with the ability to borrow books electronically and a record of borrowed books. It was built using PHP OOP and MySQL with a user interface designed with CSS, JS, and HTML, and it includes a payment system (Paypal).

Task Management

I developed a task and group management system using Laravel and Livewire, which includes creating tasks, managing members, sending dynamic notifications (invitations, accept/reject, updates), with support for search and filtering and instant notifications. I used TailwindCSS for responsive design.

Share with me

Building a system for managing and renting tools using Laravel and Livewire with support for two languages (Arabic and Hausa) for a multilingual user experience. The system includes adding tools with their images, filtering them by category, location, and status, and managing their status (available/rented). The system is also integrated with an electronic payment method to process payment and deposit transactions, using MySQL and Seeders to generate test data. The project focuses on providing a user-friendly and dynamic interface based on real-time updates through Livewire.

Electronic bank project ATM simulation

A simple web application using HTML, CSS, and JavaScript for managing bank accounts. It allows user registration, login and logout, transfers between accounts, displaying the current balance, and tracking transactions in a special log using LocalStorage.

Skills

Laravel Framework

PHP OOP

Vue.js

MySQL

TailwindCSS

JavaScript

RESTful APIs

Laravel Livewire
